<hr/> <p>(54) Title: DEVICE AND METHOD FOR CONTINUOUS MIXING</p> <p>(57) Abstract</p> <p>A device for continuous mixing of at least two components, such as liquids and/or powders. The device comprises a first means (8, 15) for joining the components in layers, and a second means (6, 18) for discharging the joined components during simultaneous deformation of a layer structure obtained in the joining, to provide a homogeneous mixture of components. The device is characterised in that the first means (8, 15) comprises a layering means (8) and a receiving means (15) rotatable about a longitudinal axis (13) and having a receiving surface (22) which faces the layering means (8) and is arranged radially outside the same. The layering means (8) is adapted to alternately dispose the components in the form of thin layers on the receiving surface (22) to form a stratum of layer structure, and the receiving means (15) is during rotation adapted to support said stratum. The present invention also relates to a method for continuous mixing of at least two components.</p>
